# A Special Case Study in LPP 

${ }^{1}$ Dr.K.V.L.N.Acharyulu<br>Associate Professor, Department of Mathematics, Bapatla Engineering College, Bapatla.<br>${ }^{3}$ B.Sri Satya Rajani,<br>II M.sc, Dept. of Maths, Bapatla Engineering College, Bapatla.

#### Abstract

The paper is intended to study a special problem in LPP. It is constituted by taking even coefficients in the objective function and successive terms of coefficients in the constrains. Few cases are thoroughly investigated. Some considerable results are obtained.In this study, the generalised optimum basic feasible solutions are traced in three cases.

## 1. Introduction:

The applications of some operations research techniques are useful to find out the possibility along several methods of working to get an optimal value of the course of action. In this way,it is necessary to prepare a mathematical model $[2,6]$. This model exhibits the solution of system used for decision analysis. Forming a mathematical model means transforming the stated description and numerical data into mathematical expressions. This shows relation among various decision variables, objective function and constraints. Generally, the basis of optimality may be performance, profit, cost, time utility, etc.
George B Dantzing[4] started LP model to trace suitable solution for the military logistic problems during his work with the US Air Force at the time of $2^{\text {nd }}$ world war in 1947. Now, it is widely applied in all zones of management, agriculture, military operations, education, transportation planning and scheduling, research and development, health care systems etc. Even though, these implementations are different, all LP models have some common properties $[1,3]$ that are needed for the decision makers to understand the constraints properly.
Initially, let us see the meaning of the words linear and programming. The word "linear" speaks of the relation among variables in a model and the word "programming" speaks of the mathematical modeling and solving of a problem that includes the plan of order to achieve the objective.

### 1.1 Advantages of liner programming:

The linear programming methods have the following advantages:
(i). It upgrades the decision quality.
(ii). It helps the decision makers to make the use of their available capital.
(iii). It also helps to obtain an optimum solution.

### 1.2 Limitations of linear programming:

Through LP has many advantages and applications in various zones, there are certain limitations in this method. They are:
(i).Linear programming supposes linear relationship amid decision variables. But in real-life problems it is not so.
(ii). There is no assurance of getting integer values for decision variables.
(iii).This method does not consider the effect of time and uncertainty.
(iv). Linear programming works with only single objective while in real-life cases, there may be multiple objectives.

### 1.3 Application Areas of linear programming:

Linear programming technique is extensively used for decision making in business, industry and many other areas such as Applications in Agriculture,Military,Production Management,Financial Management \& Personal Management.

### 1.4 Simplex Method:

When the real life problem is formed into a linear programming, if that problem has more than one variable then there is need to find out an optimum solution. For such cases, we have a mechanism called Simplex Method. In 1947,GB Dantzing[5] brought this method into existence.

## 2. Simplex Algorithm:

Simplex method is employed to investigate the nature of the solution for the constituted LPP.
Step(1): Let us start with the objective function whether it is maximized or not. If not, we have to convert the minimization problem into maximization by using the relation $\min \mathrm{z}=-\max (-\mathrm{z})$

Step(2):All $b_{i}$ 's in the constraints should be at positive level. Otherwise, all $b_{i}$ 's should be converted as positive by multiplying the constraint by negative sign.
Step(3):Introduce slack variables or surplus variables along with artificial variables in the given constrains to make them equality constraints.

Step(4):In case of introducing surplus variables along with artificial variables, we assign $-M$ to the artificial variables in the objective function.
Step(5): For getting initial basic feasible solution, the non- basic variables are to be vanished.
Step(6): In this method, first we find the entering variable based on the minimum value of $\mathrm{z}_{\mathrm{j}}-\mathrm{c}_{\mathrm{j}}$. The corresponding column of entering variable is known as 'pivot column'.

Step(7): By taking the minimum ratio of the value of basic solution and respective value of pivot column, we get the leaving variable. The corresponding row of the leaving variable is known as 'Pivot row'.

Step(8):The column value of pivot row and pivot column is the pivot element. By the simplex method, the pivot element must be converted to unity and other elements in the pivot column are to be converted as zeroes by using elementary row transformations.
Step(9): The process is continued until the optimum condition $\left(z_{j}-\mathrm{c}_{\mathrm{j}}>0\right)$ is satisfied including the artificial variable at zero level. Otherwise, go to step:10
$\operatorname{Step}(10)$ :When all elements in the pivot column are at negative level or zero in any iteration the solution is unbounded solution. Otherwise, go to step:11

Step(11):When the artificial variables are at positive level/zero level even then if the optimality condition is satisfied, the current solution is called pseudo optimum solution(no solution).

## 3. Basic problem:

The following LPP is formed as below:
Objective function: $\operatorname{Max} Z=2 n x_{1}+(2 n+2) x_{2}+(2 n+4) x_{3}$
Subject to the constraints: $n x_{1}+(n+1) x_{2}+(n+2) x_{3} \leq$ or $\geq$ or $=(n+3)$

$$
\begin{aligned}
& (n+1) x_{1}+(n+2) x_{2}+(n+3) x_{3} \leq \text { or } \geq \text { or }=(n+4) \\
& (n+2) x_{1}+(n+3) x_{2}+(n+4) x_{3} \leq \text { or } \geq o r=(n+5) \\
& \text { and } x_{1}, x_{2}, x_{3} \geq 0
\end{aligned}
$$

It is divided into four cases.
3.1 Case (1) :All the constrains are of $\leq$ type.

Objective function: $\operatorname{Max} \mathrm{Z}=2 \mathrm{nx}_{1}+(2 n+2) \mathbf{x}_{2}+(2 n+4) \mathbf{x}_{3}$
Subject to the constraints: $\mathrm{nx}_{1}+(\mathrm{n}+1) \mathrm{x}_{2}+(\mathrm{n}+2) \mathrm{x}_{3} \leq(\mathrm{n}+3)$

$$
\begin{aligned}
(n+1) x_{1}+(n+2) x_{2}+(n+3) x_{3} & \leq(n+4) \\
(n+2) x_{1}+(n+3) x_{2}+(n+4) x_{3} & \leq(n+5) \\
& \text { and } x_{1}, x_{2}, x_{3} \geq 0
\end{aligned}
$$

By applying simplex method, we get the following table when $n=1,2,3,4,5 \& 6$.
Table-1

| Iteration | Objective <br> function $=\mathbf{M a x Z}$ | Entering <br> Variable | Leaving <br> Variable | Pivot <br> Position $(\mathbf{k}, \mathbf{r})$ | Are any variables introduced? | Is <br> optimality <br> condition <br> satisfied? | Optimum basic feasible solution | Does it contain Alternative solution? |

### 3.1.1 Conclusions:

In this case, the following conclusions are established:
(i).Three slack variables are introduced in the Constraints.
(ii).Only $\mathrm{x}_{3}$ enters into the Basis and $\mathrm{s}_{3}$ leaves from the Basis.
(iii).The Pivot position is always occured as $(3,3)$
(iv).The optimum basic feasible solution is obtained as $x_{1}=0, x_{2}=0, x_{3}=(n+5) /(n+4)$
(v).The value of the objective function is Max $\mathrm{Z}=(2 \mathrm{n}+4)(\mathrm{n}+5) /(\mathrm{n}+4)$
(vi).No alternative solution is obtained.

### 3.2 Case (II):

First constraint is of type $\leq$ and the remaining two are of type $\geq$.
Objective function: $\operatorname{MaxZ}=2 \mathrm{nx}_{1}+(2 n+2) \mathbf{x}_{2}+(2 n+4) \mathbf{x}_{3}$
Subject to the constraints: $\mathrm{nx}_{1}+(n+1) \mathrm{x}_{2}+(n+2) \mathrm{x}_{3} \leq(\mathrm{n}+3)$

$$
\begin{aligned}
& (n+1) x_{1}+(n+2) x_{2}+(n+3) x_{3} \geq(n+4) \\
& (n+2) x_{1}+(n+3) x_{2}+(n+4) x_{3} \geq(n+5) \\
& \quad \text { and } x_{1}, x_{2}, x_{3} \geq 0
\end{aligned}
$$

By applying simplex method, we get the following table when $n=1,2,3,4,5 \& 6$

Table-2

| Iteration | Objective function $=\mathbf{M a x} \mathbf{Z}$ | Entering <br> Variable | Leaving <br> Variable | Pivot <br> Position $(\mathbf{k}, \mathbf{r})$ | Are any variables introduced? | Is optimality condition satisfied? | Optimum basic feasible solution | Does it contain Alternative solution? |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 3.2.1 Conclusions:

In this Case, the following conclusions are drawn:
(i).One Slack variable,two Surplus Variables \& two Artificial Variables are introduced in the Constraints.
(ii).In the first iteration: Entering Variable- $\mathrm{x}_{3}$, Leaving Variable- $\mathrm{A}_{2}$;

In the Second iteration: Entering Variable- $\mathrm{S}_{3}$, Leaving Variable- $\mathrm{A}_{1}$;
In the Third iteration: Entering Variable- $\mathrm{S}_{2}$, Leaving Variable- $\mathrm{S}_{1}$
(iii).The Pivot position moves from the position $(3,3)$ in the first iteration to the position( 6,2 ) in the second iteration \& from the position $(6,2)$ in the Second iteration to the position $(5,1)$ in the Third iteration.
(iv).The optimum basic feasible solution is obtained as $\mathrm{x}_{1}=0, \mathrm{x}_{2}=0, \mathrm{x}_{3}=(\mathrm{n}+3) /(\mathrm{n}+2)$ at third iteration itself.
(v).The value of the objective function is Max $\mathrm{Z}=2 \mathrm{n}+6$
(vi).An alternative solution is obtained as $\mathrm{x}_{1}=(\mathrm{n}+3) / \mathrm{n}, \mathrm{x}_{2}=0, \mathrm{x}_{3}=0$

### 3.3 Case(III):

First and Second constraints are of type $\leq$ and the remaining third one is of type $\geq$.
Objective fuction: Max $Z=2 n \times 1+(2 n+2) \mathbf{x}_{2}+(2 n+4) \mathbf{x}_{3}$
Subject to the constraints:

$$
\begin{aligned}
& n x_{1}+(n+1) x_{2}+(n+2) x_{3} \leq(n+3) \\
& (n+1) x_{1}+(n+2) x_{2}+(n+3) x_{3} \leq(n+4) \\
& (n+2) x_{1}+(n+3) x_{2}+(n+4) x_{3} \geq(n+5)
\end{aligned}
$$

and $\mathbf{x}_{1}, \mathbf{x}_{2}, \mathbf{x}_{3} \geq \mathbf{0}$
By applying simplex method, we get the following table when $n=1,2,3,4,5 \& 6$
Table-3

| Iteration | Objective <br> function $=\mathbf{M a x Z}$ | Entering <br> Variable | Leaving <br> Variable | Pivot <br> Position <br> (k,r) | Are any variables introduced? | Is optimality condition satisfied? | Optimum <br> basic <br> feasible <br> solution | Does it contain Alternative solution? |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| When $\mathrm{n}=1$ |  |  |  |  |  |  |  |  |
| Initial <br> First <br> Second | $\begin{aligned} & -6 \mathrm{M} \\ & 36 / 5 \\ & 15 / 2 \end{aligned}$ | $\begin{aligned} & x_{3} \\ & \mathrm{~s}_{3} \end{aligned}$ | $\begin{aligned} & \mathrm{A}_{1} \\ & \mathrm{~s}_{2} \end{aligned}$ | $\begin{aligned} & (3,3) \\ & (6,2) \end{aligned}$ | Slack (2) <br> Surplus(1) <br> Artificial(1) <br> variables | No <br> No Yes | $X=\left(\begin{array}{c} 0 \\ 0 \\ 5 / 4 \end{array}\right)$ | No |

| When $\mathrm{n}=2$ |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Initial <br> First <br> Second | $\begin{aligned} & -7 M \\ & 28 / 3 \\ & 48 / 5 \end{aligned}$ | $\mathrm{X}_{3}$ $\mathrm{~s}_{3}$ | $\begin{gathered} \mathrm{A}_{1} \\ \mathrm{~s}_{2} \\ * \end{gathered}$ | $\begin{gathered} (3,3) \\ (6,2) \\ * \end{gathered}$ | Slack (2) <br> Surplus(1) <br> Artificial(1) <br> variables | No <br> No <br> Yes | $\mathrm{X}=\left(\begin{array}{c}0 \\ 0 \\ 6 / 5\end{array}\right)$ | No |
| When $\mathrm{n}=3$ |  |  |  |  |  |  |  |  |
| Initial <br> First <br> Second | $\begin{aligned} & -8 \mathrm{M} \\ & 80 / 7 \\ & 35 / 3 \end{aligned}$ | $\mathrm{x}_{3}$ $\mathrm{~s}_{3}$ | $\begin{gathered} \mathrm{A}_{1} \\ \mathrm{~s}_{2} \\ * \end{gathered}$ | $\begin{gathered} (3,3) \\ (6,2) \\ * \end{gathered}$ | Slack (2) <br> Surplus(1) <br> Artificial(1) <br> variables | No <br> No <br> Yes | $\mathrm{X}=\left(\begin{array}{c}0 \\ 0 \\ 7 / 6\end{array}\right)$ | No |
| When $\mathrm{n}=4$ |  |  |  |  |  |  |  |  |
| Initial <br> First <br> Second | $\begin{aligned} & -9 \mathrm{M} \\ & 27 / 2 \\ & 96 / 7 \end{aligned}$ | $\mathrm{x}_{3}$ $\mathrm{~s}_{3}$ | $\begin{gathered} \mathrm{A}_{1} \\ \mathrm{~s}_{2} \\ * \end{gathered}$ | $\begin{gathered} (3,3) \\ (6,2) \\ * \end{gathered}$ | Slack (2) <br> Surplus(1) <br> Artificial(1) <br> variables | No <br> No <br> Yes | $\mathrm{X}=\left(\begin{array}{c}0 \\ 0 \\ 8 / 7\end{array}\right)$ | No |
| When $\mathrm{n}=5$ |  |  |  |  |  |  |  |  |
| Initial <br> First Second | $\begin{gathered} -10 \mathrm{M} \\ 140 / 9 \\ 63 / 4 \end{gathered}$ | $\mathrm{x}_{3}$ $\mathrm{~s}_{3}$ | $\mathrm{A}_{1}$ <br> $\mathrm{S}_{2}$ | $\begin{aligned} & (3,3) \\ & (6,2) \end{aligned}$ | Slack (2) <br> Surplus(1) <br> Artificial(1) <br> variables | No <br> No Yes | $\mathrm{X}=\left(\begin{array}{c}0 \\ 0 \\ 9 / 8\end{array}\right)$ | No |
| When $\mathrm{n}=6$ |  |  |  |  |  |  |  |  |
| Initial <br> First Second | $\begin{gathered} -11 \mathrm{M} \\ 88 / 5 \\ 160 / 9 \end{gathered}$ | $\mathrm{x}_{3}$ $\mathrm{~s}_{3}$ | $\begin{aligned} & \mathrm{A}_{1} \\ & \mathrm{~s}_{2} \end{aligned}$ | $\begin{aligned} & (3,3) \\ & (6,2) \end{aligned}$ | Slack (2) <br> Surplus(1) <br> Artificial(1) <br> variables | No <br> No <br> Yes | $\mathrm{X}=\left(\begin{array}{c}0 \\ 0 \\ 10 / 9\end{array}\right)$ | No |

### 3.3.1 Conclusions:

In this Case, the following conclusions are established:
(i).Two Slack variables, One Surplus Variable \& One Artificial Variable are introduced in the Constraints.
(ii).In the first iteration: Entering Variable- $\mathrm{x}_{3}$, Leaving Variable- $\mathrm{A}_{1}$;

In the Second iteration: Entering Variable- $\mathrm{S}_{3}$, Leaving Variable- $\mathrm{S}_{2}$;
(iii).The Pivot position moves from the position $(3,3)$ in the first iteration to the position $(6,2)$ in the second iteration.
(iv).The optimum basic feasible solution $x_{1}=0, x_{2}=0, x_{3}=(n+4) /(n+3)$ is obtained at second iteration.
(v).The value of the objective function is MaxZ $=(2 n+4)(n+4) /(n+3)$
(vi).No alternative solution is obtained.

### 3.4 Case (IV):

The first constraint is of type $\leq$ and the second one is of type $\geq$ and third one is of type $=$.
Objective fuction: $\operatorname{MaxZ}=2 n x_{1}+(2 n+2) x_{2}+(2 n+4) x_{3}$
Subject to the constraints:

$$
\begin{aligned}
& n x_{1}+(n+1) x_{2}+(n+2) x_{3} \leq(n+3) \\
& (n+1) x_{1}+(n+2) x_{2}+(n+3) x_{3} \geq(n+4) \\
& (n+2) x_{1}+(n+3) x_{2}+(n+4) x_{3}=(n+5)
\end{aligned}
$$

$$
\text { and } \mathbf{x}_{1}, \mathbf{x}_{2}, \mathbf{x}_{3} \geq 0
$$

By applying simplex method, we get the following table when $n=1,2,3,4,5 \& 6$
Table-4

| Iteration | Objective <br> function $=\mathbf{M a x Z}$ | Entering Variable | Leaving <br> Variable | Pivot <br> Position $(\mathbf{k}, \mathbf{r})$ | Are any variables introduced? | Is optimality condition satisfied? | Optimum <br> basic <br> feasible <br> solution | Does it contain Alternative solution? |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| When $\mathrm{n}=1$ |  |  |  |  |  |  |  |  |
| Initial <br> First | $\begin{gathered} -11 \mathrm{M} \\ (-\mathrm{M}+36) / 5 \end{gathered}$ | $\mathrm{x}_{3}$ | $\mathrm{S}_{3}$ | $(3,3)$ | Slack (1) <br> Surplus(1) <br> Artificial(2) <br> variables | No Yes | No | No |
| When n=2 |  |  |  |  |  |  |  |  |
| Initial <br> First | $\begin{gathered} -13 \mathrm{M} \\ (-\mathrm{M}+56) / 6 \end{gathered}$ | $\mathrm{x}_{3}$ | $\mathrm{S}_{3}$ | $(3,3)$ | Slack (1) <br> Surplus(1) <br> Artificial(2) variables | No <br> Yes | No | No |
| When $\mathrm{n}=3$ |  |  |  |  |  |  |  |  |
| Initial <br> First | $-15 \mathrm{M}$ $(-\mathrm{M}+80) / 7$ | $\mathrm{x}_{3}$ | $\mathrm{s}_{3}$ | $(3,3)$ | Slack (1) <br> Surplus(1) <br> Artificial(2) <br> variables | No <br> Yes | No | No |
| When n=4 |  |  |  |  |  |  |  |  |

### 3.4.1 Conclusions:

In this Case, the following conclusions are Obtained:
(i).One Slack variable, One Surplus Variables \& Two Artificial Variables are introduced in the Constraints.
(ii).In the first iteration: Entering Variable- $\mathrm{x}_{3}$, Leaving Variable-S $\mathrm{S}_{3}$.
(iii).The Pivot position in the first iteration is $(3,3)$.
(iv).No optimum basic feasible solution is obtained.
4. Over all Conclusions: The following over all conclusions are made through this resaerch work.

| Case | Optimum Basic Feasible Solution (X) | The value of the objective function(Z) | An Alternative Solution(if exists) |
| :---: | :---: | :---: | :---: |
| I | $\mathrm{x}_{1}=0, \mathrm{x}_{2}=0, \mathrm{x}_{3}=(\mathrm{n}+5) /(\mathrm{n}+4)$ | MaxZ $=(2 \mathrm{n}+4)(\mathrm{n}+5) /(\mathrm{n}+4)$ | No |
| II | $\mathrm{x}_{1}=0, \mathrm{x}_{2}=0, \mathrm{x}_{3}=(\mathrm{n}+3) /(\mathrm{n}+2)$ | MaxZ $=2 \mathrm{n}+6$ | $\begin{gathered} \mathrm{x}_{1}=(\mathrm{n}+3) / \mathrm{n}, \\ \mathrm{x}_{2}=0, \\ \mathrm{x}_{3}=0 \end{gathered}$ |
| III | $\mathrm{x}_{1}=0, \mathrm{x}_{2}=0, \mathrm{x}_{3}=(\mathrm{n}+4) /(\mathrm{n}+3)$ | MaxZ $=(2 \mathrm{n}+4)(\mathrm{n}+4) /(\mathrm{n}+3)$ | No |
| IV | No | $\begin{gathered} \operatorname{Max~Z}= \\ (-\mathrm{M}+(2 \mathrm{n}+4)(\mathrm{n}+5)) /(\mathrm{n}+4) \end{gathered}$ | No |
